

CMU CS11-737: Multilingual NLP (Fall 2020)

Unsupervised Machine Translation

Sachin Kumar

Carnegie Mellon University

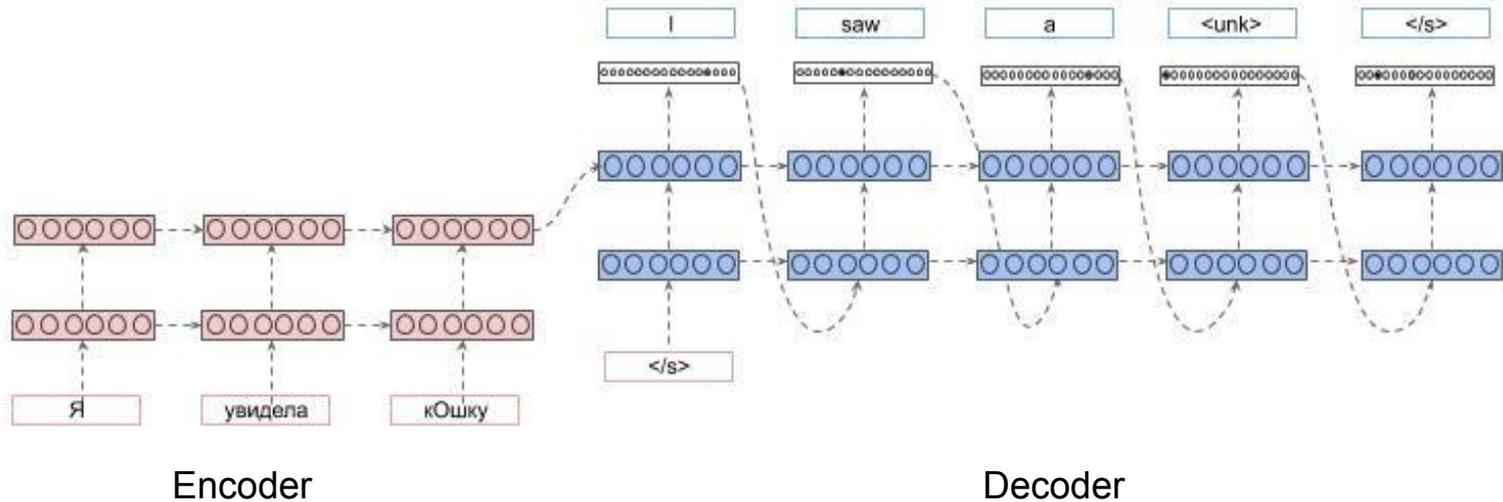

Language Technologies Institute

Conditional Text Generation

- Generate text according to a specification: $P(Y|X)$

Input X	Output Y (Text)	Task
English	Hindi	Machine Translation
Image	Text	Image Captioning
Document	Short Description	Summarization
Speech	Transcript	Speech Recognition

Modeling: Conditional Language Models

How to estimate model parameters?

- Maximum Likelihood Estimation
- Needs supervision -> **parallel data**! Usually millions of parallel sentences

What if we don't have parallel data?

Input X	Output Y	Task
Image (Photo)	Image (Painting)	Style Transfer
Image (Male)	Image (Female)	Gender Transfer
Text (Impolite)	Text (Polite)	Formality Transfer
English	Sinhalese	Machine Translation
Positive Review	Negative Review	Sentiment Transfer

Can't we just collect/generate the data?

- Too time consuming/expensive 💰💰
- Difficult to specify what to generate (or evaluate the quality of generations)
 - Generate text like Donald Trump
- Asking annotators to generate text doesn't usually lead to good quality datasets

Unsupervised Machine Translation

Previous Lectures:

1. How can we use monolingual data to improve an MT system
2. How can we reduce the amount of supervision (or make things work when supervision is scarce)

This Lecture:

Can we learn WITHOUT ANY supervision

Outline

1. Core concepts in Unsupervised MT

a. Initialization

b. Iterative Back Translation

c. Bidirectional model sharing

d. Denoising auto-encoding

} Statistical MT

} Neural MT

2. Open Problems/Advances in Unsupervised MT

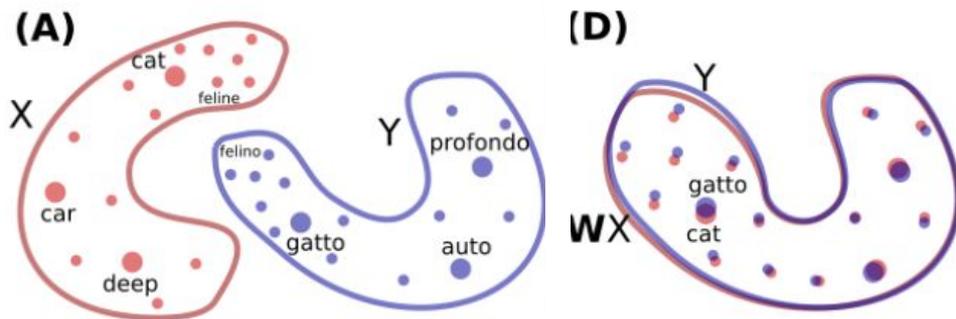

Step 1: Initialization

- Prerequisite for unsupervised MT:
 - To add a good prior to the state of solutions we want to reach
 - Kickstarting the solution - use approximate translations of sub-words/words/phrases

- the context of a word, is often similar across languages since each language refers to the same underlying physical world.

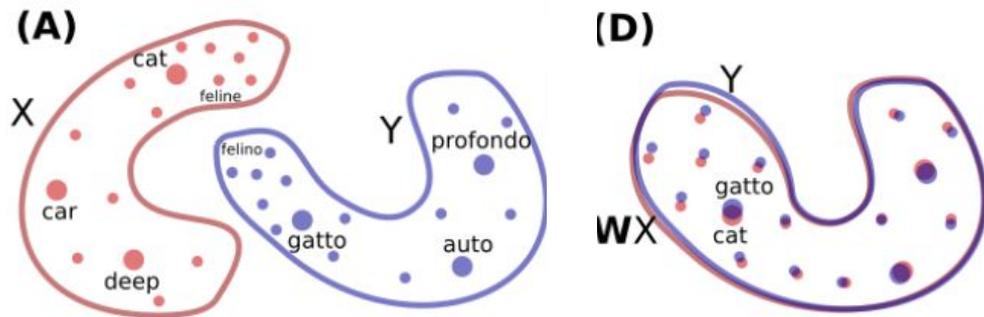

Initialization: Unsupervised **Word** Translation

- Hypothesis: Word embedding spaces in two languages are isomorphic
 - One embedding space can be linearly transformed into another
 - Give monolingual embeddings X and Y , learn a (orthogonal) matrix, such that, $WX = Y$

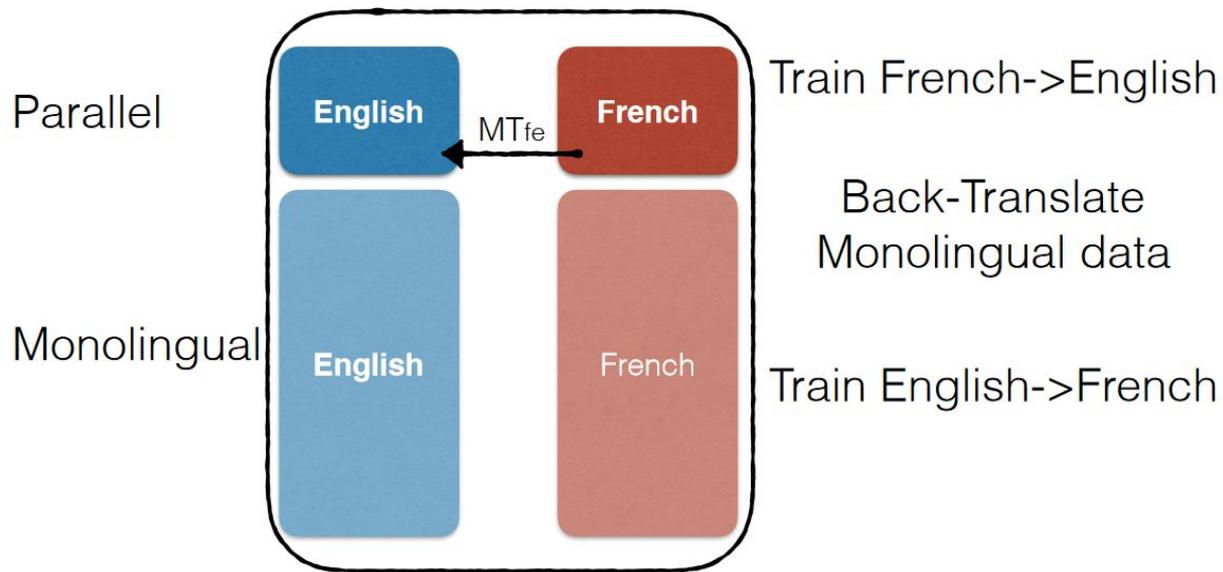

Unsupervised **Word** Translation: Adversarial Training

- Use adversarial learning to learn W :
 - If WX and Y are perfectly aligned, a discriminator shouldn't be able to tell
 - Discriminator: Predict whether an embedding is from Y or the transformed space WX .
 - Train W to confuse the discriminator

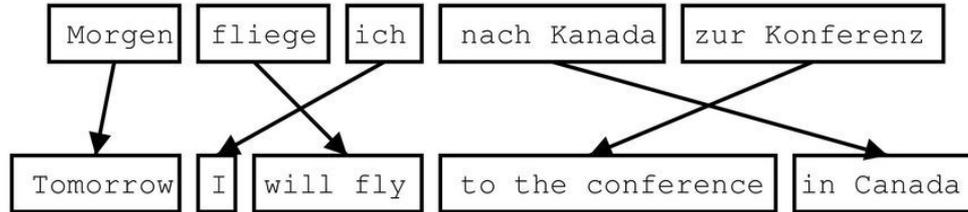

Step 2: Back-translation

- Models never see bad translations only bad inputs
- Generate back-translated data, train model in both directions, repeat: iterative back-translation

Applying these steps to non-neural MT

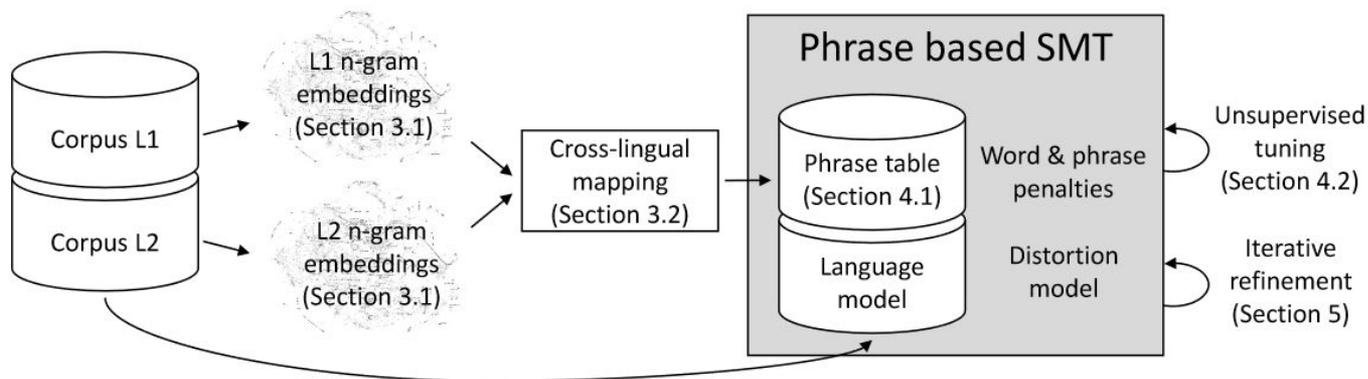

One slide primer on phrase-based statistical MT

- Foreign input is segmented in phrases
 - any sequence of words, *not necessarily linguistically motivated*
- Each phrase is translated into English ← Needs parallel data :(
- Phrases are reordered ← Only monolingual data needed :)

Unsupervised Statistical MT

- Learn monolingual embeddings for unigram, bigram and trigrams
- Initialize phrase-tables from cross-lingual mappings
- Supervised training based on back-translation
- Iterate

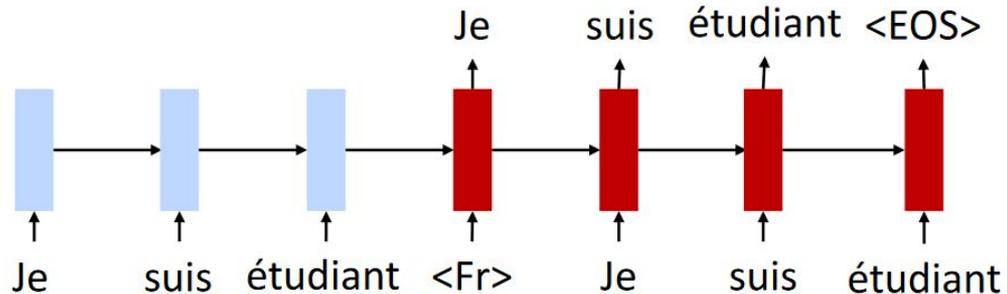

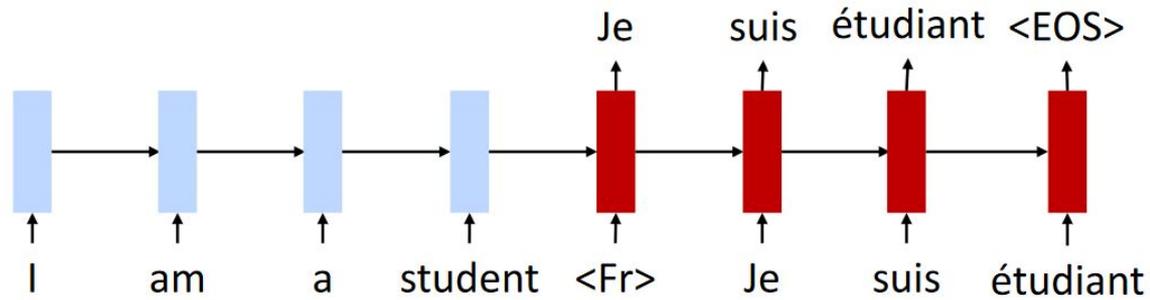

Unsupervised Statistical MT

	en → fr	fr → en	en → de	de → en	en → ro	ro → en	en → ru	ru → en
<i>Unsupervised PBSMT</i>								
Unsupervised phrase table	-	17.50	-	15.63	-	14.10	-	8.08
Back-translation - Iter. 1	24.79	26.16	15.92	22.43	18.21	21.49	11.04	15.16
Back-translation - Iter. 2	27.32	26.80	17.65	22.85	20.61	22.52	12.87	16.42
Back-translation - Iter. 3	27.77	26.93	17.94	22.87	21.18	22.99	13.13	16.52
Back-translation - Iter. 4	27.84	27.20	17.77	22.68	21.33	23.01	13.37	16.62
Back-translation - Iter. 5	28.11	27.16	-	-	-	-	-	-

Unsupervised Neural MT

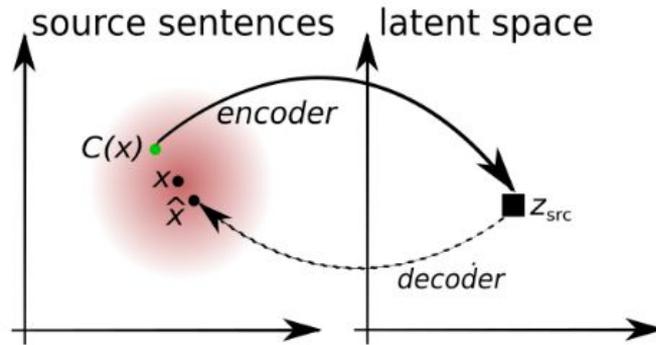

Step 3: Bidirectional Modeling

- Model: **same** encoder-decoder used for both languages
 - Initialize with cross-lingual word embeddings

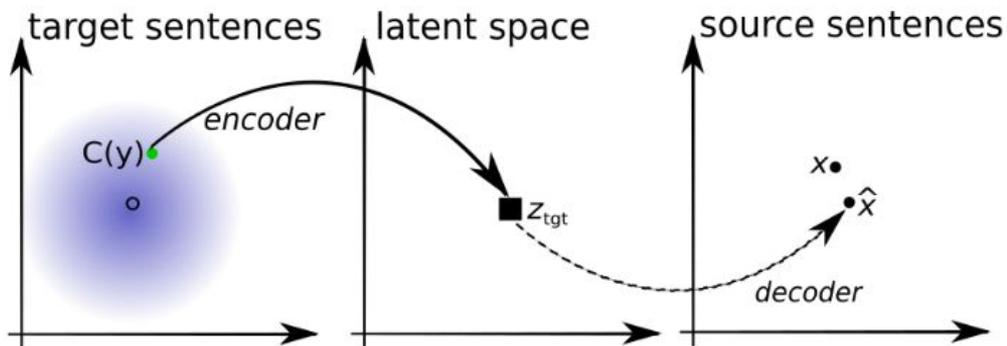

Unsupervised MT: Training Objective 1

Denosing autoencoder

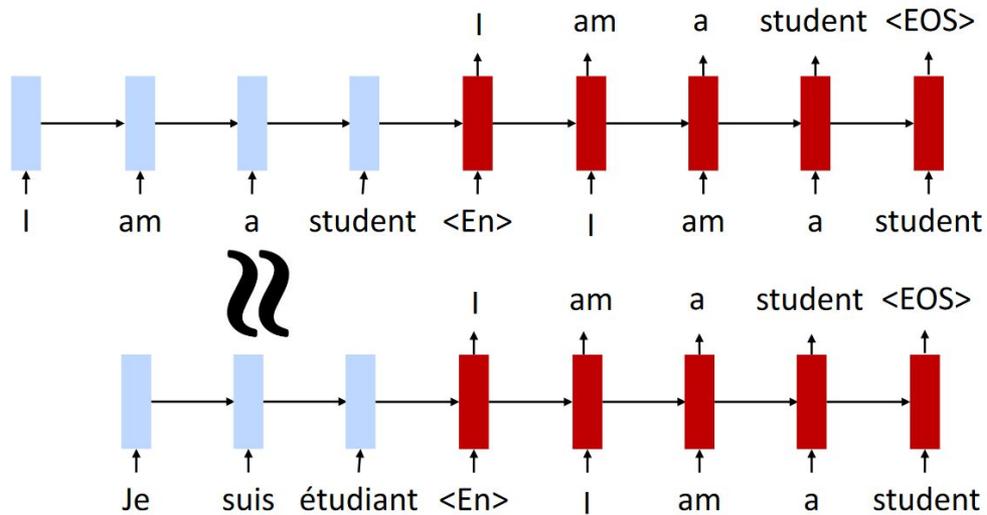

Unsupervised NMT: Training Objective 2

- Back-translation
 - Translate target to source
 - Use as a “supervised” example to translate source to target

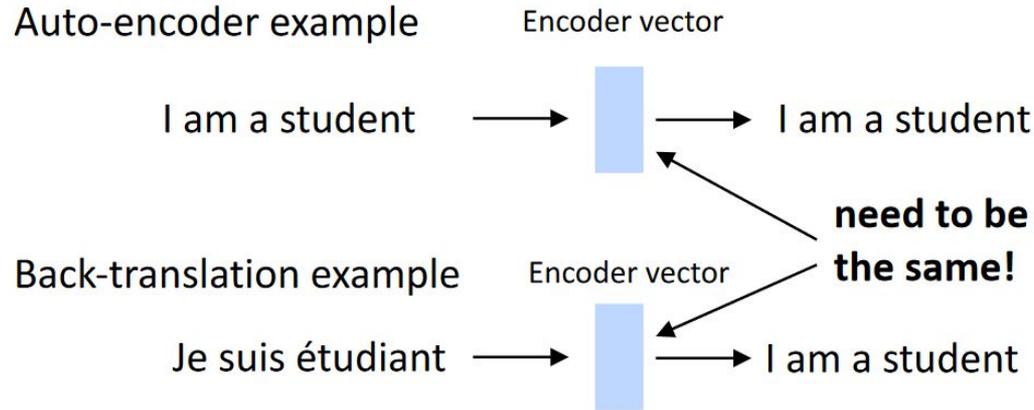

How does it work?

- Cross lingual embeddings and a shared encoder gives the model a good starting point

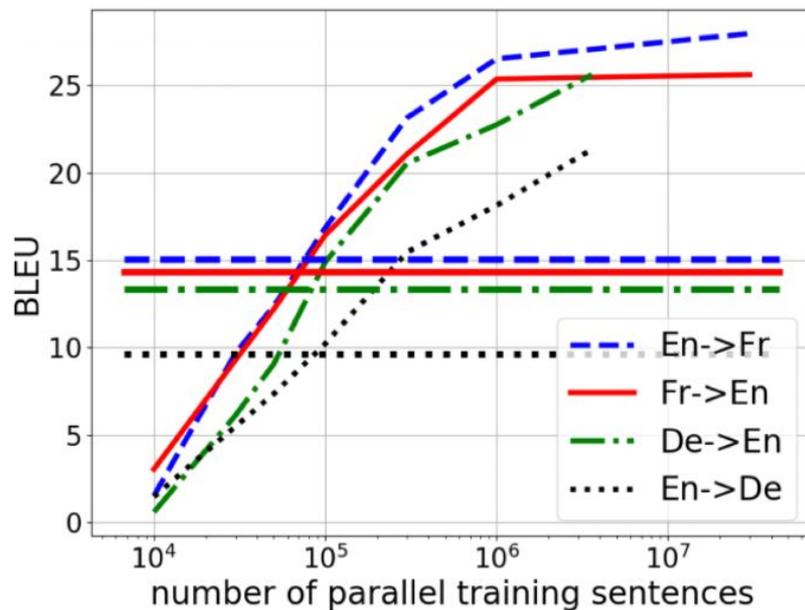

Unsupervised MT

- Training Objective 3: Adversarial
 - Constraining the encoder to map the two languages in the same feature space

Performance

- Horizontal Lines are unsupervised, rest are supervised

In summary

- Initialization is important
 - To introduce biases
- Need Monolingual data
 - both of good initialization/alignments and learning a language model
- Iterative refinement
 - Noisy data-augmentation

Open Problems with Unsupervised MT

When Does Unsupervised Machine Translation Work?

- In sterile environments
 - Languages are fairly similar languages written with similar writing systems.
 - Large monolingual datasets are in the same domain and match the test domains
- On less related languages, truly low resource languages, diverse domains, or less amounts of monolingual data UMT performs less well.

	En-Turkish	Ne-En	Si-En
Supervised	20	7.6	7.2
UNMT	4.5	0.2	0.4

Reasons for this poor performance

Graham Neubig

@gneubig

Reasons why real low-resource languages make unsupervised MT difficult: (1) small monolingual data -> bad embeddings, (2) different word frequencies/morphology hurt bilingual lexicon induction, (3) different content makes sentence-level distribution matching difficult.

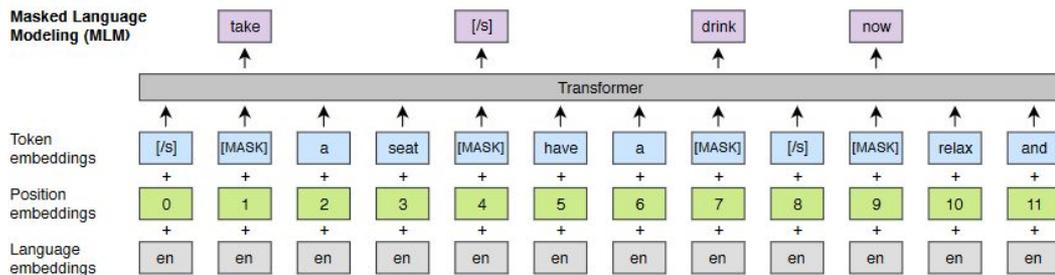

Open Problems

- Diverse languages and domains.
 - Better cross-lingual initialization: better data selection/regularization in pretraining language models

- What if no (or very little) monolingual data is available.
 - A tiny amount of parallel data goes a long way than massive monolingual data:
Semi-supervised learning
 - Make use related languages

Better Initialization: Cross Lingual Language Models

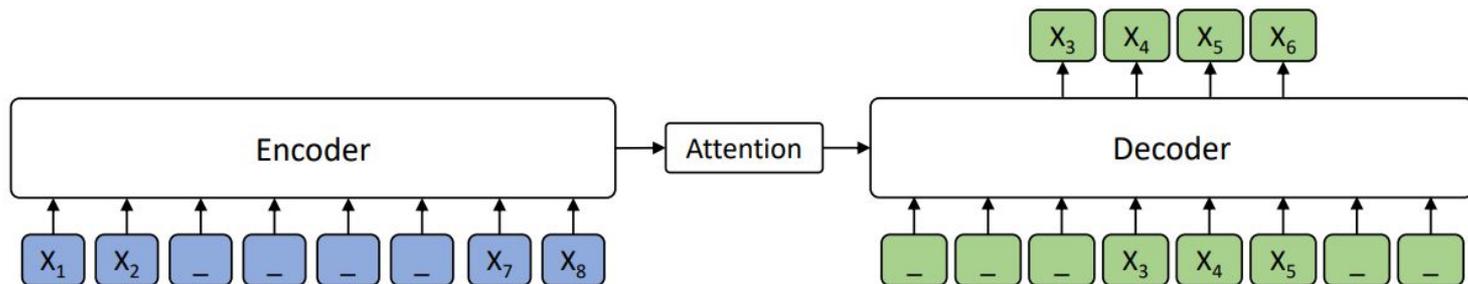

- Cross Lingual Masked Language Modelling

- Initialize the entire encoder and decoder instead of lookup tables
- Alignment comes from shared sub-word vocabulary

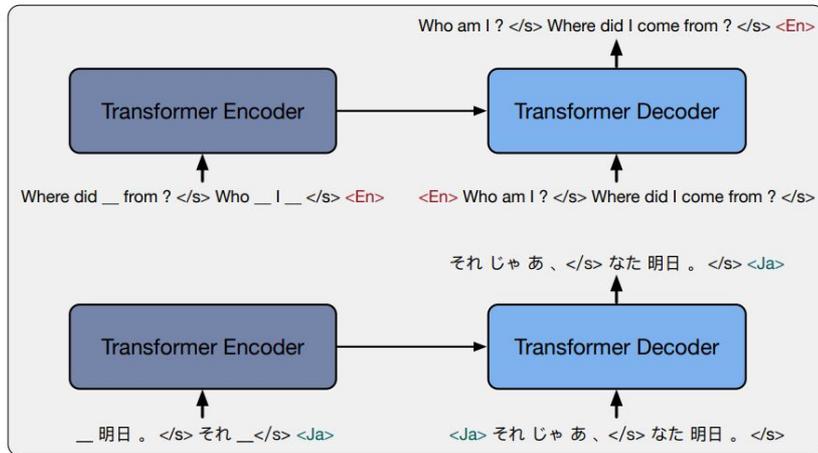

Masked Sequence to Sequence Model (MASS)

- Encoder-decoder formulation of masked language modelling

Multilingual BART

- Multilingual Denoised Autoencoding
- Corrupt the input and predict the clean version. Type of noise
 - Mask or swap words/phrases
 - Shuffle the order of sentences in an instance

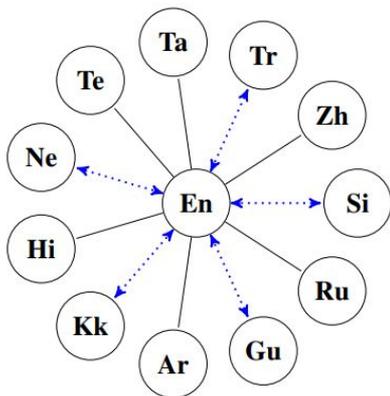

Multilingual Unsupervised MT

- Assume, three languages X, Y, Z:
 - Goal: Translate X to Z
 - We have parallel data in (X, Y) but only monolingual data for Z.
 - (If we have parallel data for (X, Z) or (Y, Z): zero-shot translation; covered in last lecture))
- Pretrain using MASS
- Two translation objectives:
 - Back-translation: $P(x | y(x))$ [Monolingual data]
 - Cross-translation: $P(y | z(x))$ [Parallel data (x, y)]
- Shows improvement for dissimilar languages with less monolingual data

Multilingual UNMT

- Shows improvements on low resource languages

	<i>FLoRes devtest</i> Ne ↔ En		<i>FLoRes devtest</i> Si ↔ En	
Unsupervised	-	-	-	-
	-	17.9*	-	8.99*
	8.3*	18.3*	0.1	0.1
Ours (Mult. Unsup.)	3.34	18.33	1.44	11.52
	8.62	20.76	7.72	15.66
	8.93	21.68	7.9	16.23
Supervised	-	-	-	-
	-	-	-	-
	-	-	-	-
	<u>9.6</u>	21.3	<u>9.3</u>	<u>20.2</u>
	8.8*	<u>21.5*</u>	6.5	15.1

If some parallel data is available?

- Semi-supervised Learning
- Train the model first with unsupervised method and fine tune using the parallel corpus OR more commonly, train the model using the parallel corpus and update with iterative back-translation

Related Area: Style Transfer

- Rewrite text in the *same* language but in a different “style”

Relaxed ↔ Annoyed	
Relaxed	Sitting by the Christmas tree and watching Star Wars after cooking dinner. What a nice night 🍷🌲🎄
Annoyed	Sitting by the computer and watching The Voice for the second time tonight. What a horrible way to start the weekend 😡😡😡
Annoyed	Getting a speeding ticket 50 feet in front of work is not how I wanted to start this month 😞
Relaxed	Getting a haircut followed by a cold foot massage in the morning is how I wanted to start this month 😊
Male ↔ Female	
Male	Gotta say that beard makes you look like a Viking...
Female	Gotta say that hair makes you look like a Mermaid...
Female	Awww he's so gorgeous 🥰 can't wait for a cuddle. Well done 🥰 xxx
Male	Bro he's so f***ing dope can't wait for a cuddle. Well done bro
Age 18-24 ↔ 65+	
18-24	You cheated on me but now I know nothing about loyalty 😏 ok
65+	You cheated on America but now I know nothing about patriotism. So ok.
65+	Ah! Sweet photo of the sisters. So happy to see them together today .
18-24	Ah 😂 Thankyou 🍷 #sisters 🍷 happy to see them together today

Discussion Question

Pick a low resource language or dialect and argue whether unsupervised MT will be a suitable for translating to it (from English).

If yes, why? If not, what could be potential solutions

Refer to: “When does unsupervised MT work?” (<https://arxiv.org/pdf/2004.14958.pdf>).
